User Account #1 (Easy Password) :

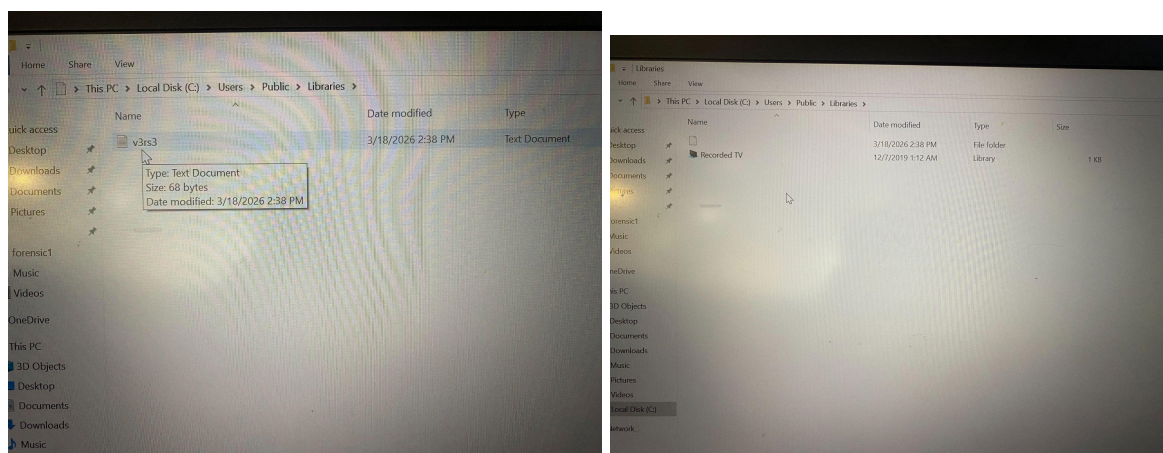

Username: DF (D'avante's Account)

Password: ILLINOIS

Method of Obfuscation: Hiding in Public Folders: Most people use their own user folders, but ignore Public folders that Windows uses for shared data. So, I put a “hidden” folder into C:\Users\Public\Libraries by renaming a folder to a blank character space and changing the icon of the folder. Within this folder, there is a text file with a bible verse.

How to defeat it: Go into C:\Users\Public\Libraries and find the hidden folder. It is not completely invisible, because if they turn on the “type” column it will reveal that there is a folder there.

User Account #2 (Medium Password):

Username: Landon Morrical

Password: 57Rendevous??7

Method of Obfuscation: Firefox Search History, a Bible verse was searched via Firefox (downloaded from Edge), and then Firefox was deleted from the computer.

How to defeat it: Looking in Edge's history reveals that Firefox was downloaded, the Bible verse can be located by either redownloading Firefox and looking at the history, or by locating the Firefox history file and extracting it from there

User Account #3 (Hard Password):

Username: Adrian (Adrian's Account)

Password: T9v\$Q7m!L2x@R8k#

Method of Obfuscation:

- System-level file obfuscation
- I placed a text file (sneakyverse.txt) into a busy system directory (C:\Windows\System32\Drivers)
- I ran the command **attrib +s +h +r sneakyverse.txt**

- This makes it a System file. By default, Windows hides "Protected operating system files" even if "Show hidden files" is turned on.

How to defeat it: They must uncheck "Hide protected operating system files" in Folder Options. (File explorer > View > Options > Change folder and search options > uncheck "Hide protected operating system files (Recommended)")
